January 13, 1998

To PHase III, Inc:

S.P. Petroleum has been incorporating Eliminator™ in to parts washing applications for over a year. The parts washers have all been made of plastics and have heaters to warm fluid to approximately 100°. There is also a filter in the drain to protect the pump for particulate matter.

S.P. Petroleum has found Eliminator™ to work as well as, if not better than, any other product we have tested in parts washing applications. After the initial set-up, we service the machines at 4 – 6 week intervals and replace the filter and add fluid to operating levels. On the average Eliminator™ lasted up to one year before it had to be evacuated and replaced.

We are pleased with Eliminator™ in our applications and are proceeding to market it this way.

You may contact us for further information.

Sincerely,
Joel Art
Account Manager
